

Space Logistics Game Case

1. The Vision

We are looking for a developer who can take a core concept and breathe life into it. The theme is Space Station Management, and the core genres are Unblocking & Sorting. However, the "how" is entirely up to you. You are the lead designer and developer for this prototype.

Understanding the Genres

Unblocking Mechanics: The core of the Unblocking genre is spatial awareness and sequence planning. It usually involves a "target object" that is trapped or obstructed by other "blocking objects" within a restricted space. The player must move the obstacles in a specific order to clear a path. In a space station context, this could represent large cargo ships blocking a narrow docking lane or rotating station rings that must be aligned to let a scout ship pass.

- **Classic Examples:** Block Out, *Rush Hour* (The board game/mobile app), *Unblock Me*.

Sorting Mechanics: The Sorting genre focuses on categorization, logic, and efficiency. It requires the player to organize chaotic elements into structured groups based on specific attributes like color, shape, or destination. The challenge often comes from limited storage space or "buffer zones." For your project, imagine ships arriving with mixed cargo colors that need to be routed to matching colored modules of the space station, or sorting ships by size into appropriate docking bays.

- **Classic Examples:** *Water Sort Puzzle*, *Sort It 3D*, *Magic Sort*.

2. Example Concept: "Deep Space Logistics"

Following is an example concept: In a busy sector of the galaxy, your Space Station is the only hub for incoming vessels. You need to manage the connection between the station and the ships.

- **The Goal:** Connect/Dock ships to their correct ports.
- **The Conflict:** Ships block paths, ports are color-coded, or docking arms need to be rotated—you decide the primary obstacle.

3. Your Mission (The Requirements)

Develop a mobile-ready prototype featuring two playable levels. We are intentionally leaving the level design and specific mechanics open-ended to see your creative process.

- **Creative Freedom:** You choose the mechanic.
 - *Example A:* A sliding puzzle where you move "freighter ships" to let a "commander ship" through.
 - *Example B:* A pipe-connect style game where you rotate space station modules to create a fuel line to ships.
 - *Example C:* A color-sorting relay where ships must be re-routed through gates to match their docking bay color.
- **Level Design:** * **Level 1:** Introduce your core mechanic in its simplest form.
- **Level 2:** Show us how that mechanic can scale in difficulty or complexity.

4. Technical & Design Guidelines

- **Platform:** Mobile (Android or iOS).
- **Engine (& Tools):** Unity, (Using Gemini, Blender, and/or other AI tools for ideation and asset generation)
- **Input:** Intuitive touch controls.
- **Assets:** You may use your own, simple primitives, or free store assets. We care about **game feel** (juice) and **clarity** over high-end 3D models.
- **Architecture:** We value clean, modular code that allows for easy addition of new levels or mechanics.

5. What We Are Looking For

Beyond just working code, we are evaluating:

- **Design Intuition:** Did you make the "unblocking" or "sorting" fun? Is the goal clear without a manual?
- **Attention to Detail:** Small touches like "space-y" UI transitions, engine glows, or satisfying docking sound effects.
- **Autonomy:** How you interpret a broad brief and turn it into a polished experience.

6. Submission

- **Repository:** Link to GitHub/GitLab.
- **Build:** A playable APK or WebGL link.
- **Designer's Note:** A brief (1-paragraph) explanation of *why* you chose the specific mechanic you implemented.

7. Monetization & Level Design Synergy

In the mobile market, a great mechanic must be supported by smart level design that naturally encourages player progression through rewarded actions. We want to see how you think about the "business" side of game design.

In your prototype or your design notes, please address how the following could be implemented:

- **The "Near-Miss" & Moves Limit (Unblocking):**

- **The Logic:** Unblocking games often use a "Move Limit" or a "Grid Lockdown." How would you design a level so that a player feels they are *just one move away* from clearing the path?

- **Monetization Point:** This creates a perfect opportunity for a "Rewarded Ad" or "Hard Currency" to buy +5 extra moves.

- **The "Full Buffer" Tension (Sorting):**

- **The Logic:** Sorting games rely on limited "extra slots" or "buffer zones." If the space station's temporary parking bays are full, the player is stuck.

- **Monetization Point:** Think about how level design can push a player to use an "Extra Docking Slot" or a "Undo" power-up. How do you balance the difficulty so the player feels challenged but motivated to pay/watch an ad to continue?

- **Progressive Difficulty & Power-Ups:**

- Could there be a "Clear Path" power-up for a cluttered orbit? Or a "Color Change" drone for sorting? How would the level design introduce these needs?

Why we are asking this:

We are not just looking for a developer, but a product-aware creator.

- **The Task:** In your Level 2 design, please briefly mention (in your README or as a UI placeholder) where a player might encounter a "bottleneck" that could be solved by a rewarded ad or a power-up.

8. Duration / Deadline: Candidate is expected to reply, submit within 7 days. Candidate may communicate, ask questions to understand the task but not to review their efforts.
